

Kiaan Marketplace — Detailed Product & Design Blueprint

Foundation decisions confirmed

Design first

No coding yet

Kiaan Marketplace will be designed as a professional software commerce and distribution platform, not a basic software listing website.

The experience should communicate three things immediately:

1. Trust: Customers feel comfortable purchasing business-critical software from Kiaan Technology.
2. Clarity: Every page explains what the software does, what is included, what it costs, and what happens after purchase.
3. Capability: The platform feels like a mature technology product, with polished interactions, thoughtful layouts, and a connected licensing system.

Your uploaded wireframes and platform specification will remain the functional foundation. This blueprint organizes that scope into a clearer product experience and implementation sequence.

What A + B + C means in the design

A — Premium Enterprise

Strong hierarchy, precise typography, structured information, polished product presentation, and confidence appropriate for business software.

B — Modern Technology

Intelligent use of whitespace, distinctive section compositions, subtle motion, refined icons, and contemporary visual details.

C — Premium Digital Store

Product-led browsing, high-quality software detail pages, clear pricing, trust signals, and frictionless purchase journeys.

These are visual references, not approved Kiaan screens or colors.

Design rule: We will not use a generic template with a logo swapped in. The design system must be created specifically for Kiaan Marketplace.

2. Platform architecture — one connected ecosystem

Kiaan Marketplace

Public discovery • Software sales • Customer experience

Public Marketplace

Browse, compare, demo, purchase

Customer Portal

Orders, licenses, downloads, support

License Cloud

Activation, domain checks, signed tokens

Admin Console

Products, orders, users, operations

Shared Backend & MySQL

Authentication • Commerce • Product data • Licensing • Audit trail

The customer should experience this as one platform—not four separate applications stitched together.

Core architectural principle

- React handles presentation and user interaction.
- Express handles business rules, authorization, payment verification, licensing, and secure distribution.
- MySQL stores platform records and relationships.
- The license authority remains on Kiaan's server.
- Customer-facing screens never determine whether a payment or license is valid by themselves.

3. Exact screen structure

A. Public marketplace

Customer-facing website

1. Global header

Structure:

- Kiaan Technology logo
- Software
- Categories
- Solutions
- Custom Development
- About Kiaan
- Search
- Sign In
- Primary action: Explore Software

Mobile: compact header, menu drawer, visible search access, no horizontal overflow.

Free Resources

Every month we pick some best products for you. This month's best web themes & templates have arrived, chosen by our content specialists.

View All Items

Exact layout:

- Page title and short introduction
- Search field
- Category filters
- Industry filters
- Price range
- Product type
- Sort by
- Result count
- Product grid
- Pagination or controlled load-more
- Empty search state
- Loading and error states

Product card information:

1. Software image or product preview
2. Product name
3. Short description
4. Category
5. Key capability tags
6. Price or pricing model
7. Live Demo action
8. View Details action

Avoid overcrowding cards with too many badges or features.

4. Product detail page

Run your business on a quieter kind of automation.

Cirrus is an unhurried operations platform for small teams. Capture every lead, draft every reply, and watch every metric move — without the dashboard noise.

Start a 14-day trial

Watch the 90-second tour

Built for teams who would *rather*
not live in the inbox.

Three small surfaces, working together. None of them ask you to manage them. The platform is the absence of the dashboard.

Unified replies

One thread per customer across email, SMS, WhatsApp, and Instagram. The AI keeps tone consistent and never re-introduces itself.

- Email live
- WhatsApp live
- Instagram syncing

Pipelines that move themselves

Leads slide from *new* to *qualified* when the signals say so. Stage rules are plain English, version-controlled, and one-click reversible.

Honest analytics

Six metrics, no vanity. Pick the one you report to your team on Monday and Cirrus quietly defends it the rest of the week.

Admin UX rules

- Tables need search, filters, sorting, pagination, and clear empty states.
- Destructive actions require confirmation.
- Status changes must show clear consequences.
- Admin actions affecting money, access, or licensing must be auditable.
- Sensitive operations should be permission-controlled.
- No fake analytics or placeholder metrics presented as real data.

4. Complete connected workflows

Workflow 1 — Browse to purchase

Important: a browser redirect to a success page is not proof of payment. The backend must verify the payment provider's webhook before granting paid access.

Workflow 2 — Secure software download

Workflow 3 — License activation

License status model

Pending

Awaiting activation

Active

Valid deployment

Expired

Validity ended

Suspended

Temporarily restricted

Revoked

Invalidated

Deactivated

Deployment released

A signed token should be verifiable by the customer backend, with private signing keys retained exclusively by Kiaan. Periodic verification and a defined grace period are part of the licensing design.

Workflow 4 — Domain transfer

1. Customer opens license details.
2. Customer requests transfer.
3. Existing activation is checked.
4. Transfer policy and any limits are applied.
5. Admin approval is required if configured by policy.
6. Old domain is deactivated.
7. New domain is registered.
8. License history is recorded.
9. Customer receives status notification.

Workflow 5 — Software updates

Admin publishes a new version → release notes are saved → eligible customers see the update → authenticated customer downloads the authorized release → download event is logged.

Workflow 6 — Support

Customer creates ticket → ticket is linked to customer/product/order → admin reviews and replies → customer receives update → conversation remains available in the portal → ticket is resolved or reopened.

5. Professional visual system — before choosing colors

You specifically asked for professional color combinations and clear text, while retaining control over the final palette.

Therefore, we will define the visual rules now, but leave actual color selection pending your approval.

Typography direction

The final font family will be selected during visual exploration.

Typography requirements:

- Distinctive, highly legible headings
- Clean body text
- Clear price and number presentation
- Consistent hierarchy
- Comfortable reading width
- No overly thin text
- No oversized headings that push useful content below the fold
- Consistent font weights and line heights

Palette approval process

We will prepare three complete visual directions, each showing:

- Brand colors
- Background and surface combinations
- Heading and body text contrast
- Buttons
- Product cards
- Forms
- Tables
- Status indicators
- Homepage preview
- Customer dashboard preview

You will choose or request changes before the palette is finalized.

6. What will make this look professional—not basic?

Visual quality requirements

Purposeful composition

Not every section uses the same centered heading and three-card layout. Hero, catalog, product detail, and dashboard each get a layout suited to their purpose.

Real product presentation

High-quality screenshots, consistent image ratios, realistic product previews, and meaningful product descriptions.

Refined interaction

Subtle hover states, meaningful transitions, clear loading feedback, and immediate confirmation after important actions.

Consistent components

One design language across buttons, forms, tables, dialogs, navigation, status badges, and product cards.

Business-first clarity

Customers should never need to guess whether they are buying source code, a license, customization, support, or a recurring service.

Explicitly avoid

- Generic AI-generated website appearance
- Random gradients and decorative blobs
- Excessive rounded cards
- Too many colors competing for attention
- Repeated sections with no purpose
- Fake counters and meaningless stats
- Tiny low-contrast text
- Unnecessary animations
- Unclear pricing or licensing language
- Desktop-only layouts

7. Complete implementation roadmap

The project will be implemented in controlled phases. Each phase will have its own scope, acceptance criteria, and verification.

1. Phase 0 · Current

Product foundation and design blueprint

- Confirm platform scope
- Confirm user roles
- Define navigation and screen inventory
- Define end-to-end journeys
- Identify business rules and security boundaries

2. Deliverable: Approved blueprint

3. Phase 1

Visual identity and UI/UX design

- Review existing Kiaan brand assets
- Explore three palette directions
- Typography selection
- Design tokens
- Buttons, forms, cards, tables, badges
- Homepage and catalog design
- Product detail design

- Customer portal and admin shell
 - Mobile and desktop variants
- 4. Deliverable: Approved design system and screen designs
- 5. Phase 2
 - Technical foundation
 - React project structure
 - Express application structure
 - MySQL schema planning
 - Authentication and authorization design
 - API conventions
 - Environment configuration
 - Error handling and logging
 - Development and deployment environments
- 6. Deliverable: Verified application foundation
- 7. Phase 3
 - Public marketplace
 - Homepage
 - Catalog
 - Search and filters
 - Categories
 - Product details
 - Live demo links
 - CMS/admin-managed product content
 - Responsive behavior
- 8. Deliverable: Functional software discovery experience
- 9. Phase 4
 - Authentication and customer portal
 - Registration/login
 - Password recovery
 - Customer profile
 - Dashboard
 - My Software
 - Order history
 - Account security
- 10. Deliverable: Authenticated customer workspace
- 11. Phase 5
 - Commerce and payments
 - Cart or direct checkout flow
 - Order creation
 - Payment provider integration
 - Backend webhook verification
 - Invoice generation
 - Payment pending/failure handling
 - Purchase confirmation

12. Deliverable: Verified purchase-to-order flow

13. Phase 6

Central licensing system

- License issuance
- Activation API
- Domain validation
- Signed tokens
- Periodic verification
- Grace period
- Transfer/deactivation
- Status management
- Audit trail

14. Deliverable: End-to-end license lifecycle

15. Phase 7

Secure distribution and support

- Authenticated downloads
- Temporary signed download URLs
- Version releases
- Release notes
- Download history
- Support tickets
- Customer notifications

16. Deliverable: Complete customer ownership experience

17. Phase 8

Admin operations

- Product management
- Customer management
- Orders and payments
- Licenses and activations
- Downloads and releases
- Support and reviews
- Analytics
- Audit logs
- Settings and permissions

18. Deliverable: Operational marketplace control center

19. Phase 9

Production hardening and launch

* Role and permission testing

* Payment webhook testing

* License abuse/security testing

- * Download authorization testing
- * Responsive QA
- * Accessibility checks
- * Performance optimization
- * Backup and recovery
- * Deployment verification
- * Production monitoring

Deliverable: Production-ready release candidate

8. Database foundation

The source specification identifies these core entities. They will be reviewed and normalized during technical architecture, not implemented prematurely.

|

Before schema approval, we will explicitly define relationships, unique constraints, indexes, deletion rules, ownership checks, and transaction boundaries.

9. Design acceptance checklist

Every phase must pass its relevant checklist before we move forward.

Foundation approval checklist

0/12 complete

The design follows Kiaan's existing brand identity.

All text is readable and professionally written.

The visual hierarchy is consistent across screens.

The palette has explicit approval.

Desktop, tablet, and mobile layouts are defined.

No horizontal overflow at 320px–1920px.

Every button and navigation item has a defined action.

Loading, empty, error, success, and disabled states are designed.

Customer, admin, and licensing workflows connect correctly.

Payment and license authority remain server-side.

No unrequested redesign or scope expansion.

Screenshots and functional tests are reviewed before acceptance.

Use this as the review checklist during design and implementation. It does not automatically approve or change the project.

10. Next deliverable: Visual Design Blueprint

Before development, the next design package should contain:

1. Three Kiaan palette proposals for your approval—not one silently selected.
2. Typography and text hierarchy.
3. Homepage high-fidelity design.
4. Software catalog and product detail designs.
5. Customer portal dashboard and license screens.
6. Admin dashboard and product management screens.
7. Desktop and mobile layouts.
8. Component library and interaction states.
9. Full navigation map.
10. Screen-by-screen acceptance criteria.

No code, database changes, or palette finalization at this stage.

The key design objective is that Kiaan Marketplace should feel like a carefully designed, established software company platform—professional enough for business customers, visually distinctive, and simple enough that customers can complete their tasks without confusion.
